

BACKEND UTILITY ARCHITECTURE AND METADATA SPECIFICATION

Instruction for Integration:

Do not implement these platform tools as basic text wrappers or secondary extensions. The web development team must hardcode these processing engines directly into the core functional layers of the GHOSTBUS marketplace ecosystem. The layout must use a premium, macOS inspired 3D glassmorphic styling, presenting clear interactive modules for both internal administrative compliance and public web tool availability.

The system utilizes two distinct types of audio monitoring systems:

- **Internal Security Module:** A backend validation hook powered by the third party ACRCLOUD API system to scan incoming media arrays against a master database to enforce the platform copyright policy.
- **Public Portal Utilities:** Two free browser based applications engineered to drive massive organic user traffic to the domain. This includes a high accuracy native Python script module utilizing audio processing libraries for key, tempo, and loudness matching, alongside an automated client side graphic canvas wrapper for instant cover art creation.

Strict Mandatory Linking Directive: Every single phrase or word styled in bold within the master text database below represents a high priority semantic SEO keyword anchor. You are strictly required to wrap every bold text block in an active, fully functional internal anchor link (e.g., `<a href="/marketplace"><strong>Keyword</strong></a>`). These links must render smoothly, execute without any system lag, and dynamically route the web user to their designated platform destination hub. No long horizontal dashes or double line separators are permitted anywhere across the template system.

```

SECTION 2: PRODUCTION CONTENT BLOCKS SPECS

◀ TOOL MODULE 1: INBUILT INGESTION SCANNER NODE (INTERNAL ADMINISTRATIVE MRT SYSTEM)

Technical Integration Protocol

This backend validation engine runs silently when a creator uploads a master asset bundle to the platform. The backend developer must integrate the third party ACRCLOUD API platform directly into the file ingestion loop. When the server staging area extracts a user's multi format tracking ZIP archive, it must instantly call the acoustic fingerprinting microservice to analyze the raw audio waveform vectors.

The engine cross checks the audio fingerprint against global commercial music indexes to identify copyright infringements, identical matches, or loops previously released across other storefronts before the submission goes to our manual review team.

Technical Search Meta Properties

- **Meta Search Document Title:** Automated Acoustic Fingerprinting System | GHOSTBUS Internal Security Vetting Hub
- **Meta Semantic Asset Description:** Advanced Music Recognition Technology scanner engine powered by ACRCLOUD API configurations to protect our premium music marketplace from duplicate audio listings and unauthorized song sampling.

Administrative Processing Properties Table

System Audit Step	Trigger Mechanis m Loop	Ingestion Validation Metric Target
Acoustic Waveform Analysis	Asset Ingestion Form Complete	Extract uncompressse d master WAV waveform data points
Acoustic Fingerprint Match	Third-Party ACRCLOUD Hook Sync	Compare tracking profiles against global database registries

A&R Compliance Routing	Match Evaluation Engine Execution	Reject matched audio footprints instantly to block copyright violations
---	--	--

◀ TOOL MODULE 2: CAMELOT DJ KEY CONVERTER AND ESSENTIAL AUDIO ANALYSIS TOOL (PUBLIC WEB UTILITY)

Technical Integration Protocol

Must a native backend Python service to power this public processing utility. **Do not rely on external cloud service dependencies.** The calculation script combines the numerical capabilities of the Librosa library with custom mathematical pitch mapping functions to evaluate uploaded audio files instantly.

When a user drags an audio track into the public frontend field, the library processes the waveform to calculate the exact structural metrics:

- **Tempo (BPM Processing):** Computes the exact tempo metrics by calculating standard onset strength envelopes and parsing periodic tempo periods.
- **Musical Key Matching:** Runs a chromagram analysis to determine pitch class distribution vectors across twelve notes, then applies a structural key detection model to identify major or minor modalities.

- **Loudness Measurement:** Evaluates integrated LUFS loudness targets across the complete recording runtime.
- **Camelot Wheel Conversion:** The software takes the standard alphanumeric key value and instantly converts it to its corresponding position on the classic Camelot Wheel grid structure, optimizing the track parameters for professional harmonically mixed DJ sets.

Technical Search Meta Properties

- **Meta Search Document Title:** Free Camelot DJ Key Converter Tool | Online BPM and Loudness Audio Analyzer
- **Meta Semantic Asset Description:** Use our accurate online musical key analyzer tool to compute Camelot DJ Key properties, tempo values, and LUFS loudness metrics instantly using native audio analysis scripts.

Public Application Layout Matrix

The layout requires an open file drop zone panel leading directly into a structural grid that maps the output properties illustrated below:

Analyzed Waveform Attribute	Output Format Metric	Camelot Wheel System Conversion Mapping
-----------------------------------	-------------------------	--

Computed Audio Key	Major / Minor Character Code	Maps key data directly to corresponding wheel grid values (e.g., 8A)
Estimated Song Tempo	Numerical Integer Value	Displays precise beats per minute speed tracking numbers
Integrated Loudness	LUFS Negative Integer Format	Measures spatial dynamic range values to gauge sound output balance

◀ TOOL MODULE 3: ELITE COVER ART GENERATOR PORTAL (PUBLIC WEB UTILITY)

Technical Integration Protocol

Must construct a clean visual creation workspace module to host this public image application. The frontend engineer will combine an API script link with a local canvas layout. Connect the platform container block to a high speed image generation service API loop.

When a user specifies their text prompts and picks an art style category from the interface options, the application handles the data processing, fires the generative query to the server engine, and renders a perfectly square digital artwork design directly onto the screen.

Technical Search Meta Properties

- **Meta Search Document Title:** Free AI Cover Art Generator Portal | Premium Square Visual Artwork Engine
- **Meta Semantic Asset Description:** Design premium cover artwork for your music releases instantly using our free generative image generator tool engineered specifically for independent music producers.

Visual Asset Interface Rule

Must build the tool input array using three distinct control selectors to structure the dynamic creative output perfectly:

- **Creative Prompts Input:** A large text area allowing users to outline visual scene styles, color choices, and aesthetic preferences.
- **Electronic Music Sub-Genre Selection:** A dropdown system filter containing specific stylistic definitions including Tech House, Afro House, Bigroom Techno, UK Garage, and Progressive House.

- **Canvas Title Overlay Field:** An optional form input element that lets creators position their custom song name across the graphic layout using premium minimalist typeface formatting.

TECHNICAL ARCHITECTURE DOCUMENTATION: SOUND EFFECTS, TRANSACTIONAL EMAIL PROTOCOLS, MULTI-STEP UPLOAD RIG & GLOBAL ACCOUNT SETTING HOOKS

System Font Modification Mandate: The global user interface font configuration files must be expanded across all portal layouts, grids, forms, and email rendering styles by exactly 8 to 10 percent using clean layout CSS variables. This step ensures that fine legal text and descriptive audio strings maintain an elite, high-end luxury minimalist look reminiscent of macOS interface design across high-resolution screens.

Instruction for Interactive UX Sound Systems: Do not construct a silent browsing environment. The frontend engineer must implement an advanced, elegant sound system layer integrated cleanly into the platform interface. Taking inspiration from advanced motion-driven visual layout systems, the interface must feature soft, high-fidelity sound effect triggers. Instantiation rules dictate that hovering over any product grid block, interactive card, or 3D glassmorphic option must execute a micro-sound pulse (low-amplitude audio blip). Clicking any expand trigger, left arrow element, or payment terminal button must trigger a crisp click interface sound asset. Provide an interface toggle switch inside the user navigation bar allowing immediate globally mapped muting of all sound effects at any time.

Strict Mandatory Linking Directive: Every single phrase or word styled in **bold** within the text below represents a high-priority semantic SEO keyword anchor. You are strictly required to wrap every bold text block in an active, fully functional anchor link (e.g., `<a href="/marketplace"><strong>Keyword</strong></a>`). These links must render smoothly, load with zero system lag, and dynamically route the user to their designated internal platform hub. No long horizontal dashes or line underscores are permitted anywhere across the template system.

SECTION 1: MASTER PLATFORM INFRASTRUCTURE INTERACTION MAP

SECTION 2: SYSTEM INFRASTRUCTURE SPECIFICATIONS FOR DEVELOPER

The developer must hardcode these components verbatim into the target application directories to build organic authority and rank on the first page of search results for high-intent queries.

◄ 1. AUTOMATED TRANSACTIONAL EMAIL PROTOCOL (PREMIUM IMAGE-DRIVEN ARCHITECTURE)

Instruction for Frontend/Email Layout Ingestion: All automated transaction notification mail streams dispatched to buyers and sellers who create an account on signup must be built using rich graphical components. No plain text blocks are permitted. The design system requires structured layout modules featuring high-resolution graphics, clean typography grids, and interactive button nodes. Every asset image card link must synchronize directly to the database path of the corresponding track.

Template Matrix A: Automated Buyer Engagement Notifications

Dispatched instantly whenever system tracking modules register new activity matching the user's specific platform preferences:

- **Follow Track Release Trigger Mail:** Dispatched the exact millisecond a verified producer whom the buyer follows lists a new master recording. Formatted with large visual block covers and a direct action link titled ◄ Listen to New Release.
- **Favorite Item Price Shift Trigger Mail:** Dispatched automatically if a track previously flagged as a favorite transitions to a lower target catalog value, has a discount applied, or enters a seasonal platform sale. Formatted with high-contrast asset summary blocks.
- **New Arrival Marketplace Alert Mail:** Dispatched daily as a premium compilation showcasing fresh studio arrivals across Tech House, Afro House, and Bigroom Techno. Features a multi-image carousel routing users back to the live listening catalog grids.

Template Matrix B: Automated Seller Status Notifications

Dispatched instantly by server event monitors to log account state transitions or sales actions within the portal:

- **Asset Sale Confirmation Mail:** Sent the exact millisecond a transaction clears within the checkout portal. Ingests tracking variables summarizing the target catalog value and credit allocation data.
- **Asset Vetting Approval Mail:** Dispatched when the internal A&R team finishes scanning the uncompressed audio stems and moves the track into the live marketplace.
- **Asset Vetting Rejection Mail:** Dispatched if the acoustic fingerprint scanning technology flags an unoriginal loop, non-licensed vocal, or incomplete file tree structure. Outlines the precise technical step necessary to fix the upload.
- **Milestone Progression Achievement Mail:** Triggered automatically when a seller's total transaction volume crosses permanent tier limits, moving them to a higher seller split rank (e.g., Silver, Gold, Platinum, or Diamond).
- **Account Compliance and Verification Notice:** Dispatched if security modules register authentication errors, missing identity fields, or expired tax verification parameters.

◀ 2. STRICT 3-STEP FORM ASSET UPLOAD RIG

Developer Note for Core Frontend Wizard Integration: Construct this production upload module using isolated, sequential card states. The creator cannot view Step 2 until Step 1 completely satisfies asset file validations. Every step block must feature an opacity reduction container style showing a minimal 3D look.

Step 1: Visual Ingestion Interface (The Artwork Portal)

- **Interface Layout Copy:** Drag & drop your cover artwork image or click to browse local files. Minimum required resolution is exactly 500x500 pixels. Supported file formats: PNG, JPG, JPEG only.
- **Validation Rules:** Enforce a strict perfectly square aspect ratio checking matrix before rendering the step expansion button.

Step 2: Audio Streaming Ingestion Influx (The Preview Node)

- **Interface Layout Copy:** Upload your track preview file. Maximum allowed file storage capacity is 50 megabytes. File format requirements: High quality mastered track version rendered cleanly as a standalone **320 kbps MP3 file**.
- **Validation Rules:** Enforce audio formatting bit-depth constraints to prevent low-fidelity or distorted renders from entering streaming audio slots.

Step 3: Compressed Core Master ZIP Package Extraction (The Studio Archive)

- **Interface Layout Copy:** Upload your complete track ZIP archive. Maximum allowed upload file limits are capped at 5 gigabytes. Your compressed master folder must include: all individual audio stems, all melodic MIDI lines, the mastered version vocal, the unmastered version vocal, the mastered and unmastered instrumental mixdowns, a standalone high-quality 320 kbps MP3 mix, the full text lyrics document in PDF format, and the unedited raw DAW project file sequence.
- **Validation Rules:** Reject flat directories. The folder structure must mirror the master platform repository directory layout cleanly before the upload progresses to the final compliance verification checkbox gate.

Integration Rule for Global Pricing Loops: The system backend must restrict listing configurations to the exact standard price steps illustrated below. Sellers can select their desired entry tier from this specific table row array. The platform commission engine automatically shifts baseline percentages based on the creator's lifetime transaction milestone data.

Note for Core Pricing Component Layout:

Do not implement this matrix as flat or truncated code arrays. The frontend engineer must build an interactive **Pre-Upload Earnings Calculator** directly into the track submission wizard interface. Before a creator commits their track to the platform A&R queue, they must be able to slide or toggle through the exact, hardcoded €50 increments from €249 up to €1999.

The calculator module must read the user's current verified account level token from the database session and display an instant mathematical calculation showing their exact payout fraction down to the cent. This provides absolute financial clarity before the final legal upload checkbox gate is triggered.

The global user interface font files must be expanded across this entire table module by exactly 8 to 10 percent using clean layout CSS variables. Every core keyword marked in **bold** must remain wrapped in an active, fully functional internal hyperlink pointing to its corresponding destination page. No long horizontal dashes or line underscores are permitted anywhere across this architecture.

SECTION 1: MASTER PLATFORM COMMISSION SPLIT MAP

[Seller Tier Milestone Tracking Token Engine]		
—▶	New Seller (0 to €4,999 Sales)	▶ 28% Platform Fee (72% Payout Split)
—▶	Rising Seller (€5,000 Milestone)	▶ 25% Platform Fee (75% Payout Split)
—▶	Pro Seller (€10,000 Milestone)	▶ 22% Platform Fee (78% Payout Split)
—▶	Elite Seller (€30,000 Milestone)	▶ 18% Platform Fee (82% Payout Split)
—▶	Legend Seller (€50,000 Milestone)	▶ 15% Platform Fee (85% Payout Split)

SECTION 2: HARDCODED GLOBAL OPERATIONAL VALUE MATRIX

The backend database engineer and frontend validation developer must hardcode these exact pricing increments and conditional fee structures verbatim into the target application logic:

Fixed Listing Price Tier	New Seller Fee (28%) / Payout (72%)	Rising Seller Fee (25%) / Payout (75%)	Pro Seller Fee (22%) / Payout (78%)	Elite Seller Fee (18%) / Payout (82%)	Legend Seller Fee (15%) / Payout (85%)	System Progress Calculation Standard
€249 Euro	Fee: €69.72 / Net: €179.28	Fee: €62.25 / Net: €186.75	Fee: €54.78 / Net: €194.22	Fee: €44.82 / Net: €204.18	Fee: €37.35 / Net: €211.65	Baseline marketplace entry threshold value

-----------------------	---------------------------------------	---------------------------------------	---------------------------------------	---------------------------------------	---------------------------------------	---

◀ 3. ADVANCED TECHNICAL INTEGRATION NOTES FOR FEE SYSTEM SCALING

The backend engine must track user transactions via an immutable billing log to apply these fee structures precisely. When calculating split vectors inside the **edm ghostproduction marketplace** checkout loops, the code model must query the active creator level parameters:

- **New Seller Tier Configuration:** Accounts with lifetime checkouts between €0 and €4,999 map automatically to a 28% marketplace fee allocation block, yielding a secure 72% creator payout split.
- **Rising Seller Tier Configuration:** Reaching the €5,000 milestone token immediately drops the platform commission fraction to 25%, automatically lifting the creator's payout split ratio to 75% permanently.
- **Pro Seller Tier Configuration:** Passing the €10,000 milestone threshold downscales the server system fee variable to 22%, expanding the individual asset creator profit split to 78%.
- **Elite Seller Tier Configuration:** Crossing the €30,000 marketplace volume milestone adjusts the operational framework fee down to 18%, processing a high-yield 82% net layout back into the seller wallet.

- **Legend Seller Tier Configuration:** Hitting the ultimate platform milestone value of €50,000 locks the account parameters to our lowest possible fee tier of 15%, routing an unmatched 85% maximum buyout fraction straight to the producer.

Instruction for Legal Profile Setup Configuration: Replace any occurrences of standard "KYC"  labels across all user setting menus, dashboard links, and platform subheaders with the official premium title: **Account Verification**. This dedicated interface section must be constructed as a clean, highly secure data ingestion dashboard.

Target Data Fields and Document Upload Array:

- **First Name:** Alpha String Node
- **Last Name:** Alpha String Node
- **Address:** Standard Text String Node
- **ZIP:** Numerical Character Code Node
- **City:** Alpha String Node
- **Country:** System Selection Grid Node
- **Label / Company Name:** Optional Business Registry String Node
- **Passport / National ID Document:** Secure Image/PDF File Ingestion Node
- **Driving License Document:** Secure Image/PDF File Ingestion Node
- **Verification Face Selfie Capture:** Mandatory High-Fidelity Front-Facing Camera Image File Input (Must show a clear, fully visible face in ambient lighting).
- **Payment Method Settlement Address:** Verified PayPal Withdrawal Account Field String.
- **Confirmation Verification Box:** A mandatory toggle switch checking that the identity details match the payout account information perfectly before letting the user submit the verification data tree.

ADMINISTRATIVE ASSET CONTROL AND SAMPLE PACK PRODUCT SPECIFICATION

System Layout and Font Engineering Mandate: The global user interface font configuration metrics across all public listing frameworks, sample store grids, asset detail blocks, and internal dashboard panels must be increased by exactly 8 to 10 percent using layout CSS fluid variables. This ensures absolute micro-typography scaling and an elite visual presentation reminiscent of modern macOS interfaces on high-resolution screens.

UI/UX Audio Sound Integration Layer: Do not code a silent browsing layout in the website. Must build an advanced audio playback interface layer. Hovering your mouse over any sample pack card, download trigger link, or 3D glassmorphic menu block must play a low-amplitude interface sound blip. Clicking any core structural asset path expansion element, file upload node, or processing toggle button must execute a crisp, clean user mechanical click sound file. A dedicated master sound volume toggle switch must be injected directly into the main navigation status header to allow instant muting across the global ecosystem at any time. (example IOS default sound tone's) & Give Audio Toggle to ON/OFF (if he needs sound)

Strict Mandatory Linking Directive: Every single phrase or word styled in **bold** within the text below represents a critical, high-priority keyword anchor. You are strictly required to wrap every bold text block in an active, fully functional anchor link (e.g., [<a](#)

href="/marketplace">Keyword). These links must render smoothly, execute with zero system lag, and dynamically route the user to their designated internal platform hub. No long horizontal dashes or double dash lines are permitted anywhere across the codebase.

SECTION 1: SYSTEM INFRASTRUCTURE ASSET ROUTING MAP

SECTION 2: ARCHITECTURAL COMPONENT BLUEPRINTS FOR CORE DEVELOPER

The development team must hardcode the following system specs and interface text strings directly into the primary application source directories to guarantee absolute ranking authority and clean data flows.

◀ 1. HIGH-SECURITY ADMIN CONTROL OVER ASSET DOWNLOADS AND STREAM WATERMARKING

Instruction for Core Systems Engineering: The administration control panel requires absolute asset extraction capabilities. When a seller finishes the dynamic 3-step file upload rig, all files must be organized into secure server directories. The admin review screen must show dedicated, independent single-click download paths for the original raw cover art file, the standalone presentation preview audio track, and the 5 gigabyte compressed master ZIP studio package archive.

Audio Overlay Protection Mechanics

- **The Interface Automation Rule:** When a track is submitted, the backend processing sequence must automatically merge an audio protection sound marker (the voice layout token statement) onto the presentation MP3 file layer. This file is routed directly to the public web players on the homepage catalog view rows and single track details listing pages.
- **The Administrative Update Overwrite Hook:** To protect against pipeline errors, the admin panel track item layout matrix must include an absolute file override module. The administrator must have the manual ability to download the creator's raw presentation file, process an external audio file overlay locally, and use a manual re-upload button component to instantly overwrite the protection audio preview file across the live store.

◀ 2. SOUND DESIGN SAMPLE PACK PRODUCT PAGE IN SERVICE'S MENU LISTING ENGINE

Reference Look - <https://hy2rogen.com/product/bass-house-tools/> & <https://siiksounds.com/products/sickrate-siik-essentials-iv-full-pack/?v=13b5bfe96f3e>

Instruction for Frontend Component Layout: The **sound design sample pack** product page layout must capture a high-end commercial retail storefront aesthetic. The design system must avoid relying on third-party platform embed options or standard text

links. You must eliminate external YouTube player widgets completely. Replace them with a native, inline **mp3 waveform preview audio** rendering component.

Spatial Audio Interface Layer Specifications

- **The Waveform Generation Engine:** When an administrator lists a new software product box or sound library bundle, the backend must read the demonstration file and render an interactive audio waveform line grid dynamically on the frontend canvas layer.
- **The Fluid Listening Engine:** Sourcing engineers, touring music artists, and studio professionals must be able to click directly on the generated waveform to play, pause, or skip through different audio demo regions instantly without leaving the page grid or being routed to outside video applications.

Essential Production Pack Interface Sections

- **The Visual Box Block:** Displays a high-resolution 3D graphic rendering of the sample library packaging with clear layout styling.
- **The Inclusions Technical Table:** Shows exactly what is packaged inside the delivery payload container:

Inbound Sound Asset Category	Format Output Variable	Data Integration Metrics Volume
---	---------------------------------------	--

Uncompressed Drum One Shots	WAV Audio Bitrate Standard	Crisp acoustic impact processing elements
Melodic Synthesizer Loops	WAV Audio Bitrate Standard	Complete key scale melodic construction data
Raw MIDI Progression Patterns	MIDI Character Files	Customizable data notes mapping system array
Advanced Synth Preset Files	Custom Soft Synth Formats	Direct instrument patches configuration blocks

ARCHITECTURE DOCUMENTATION: NEUTRAL ACCOUNT CONFIGURATION PORTAL

System Modification Mandate: The global user interface typography files must be expanded across all settings grids, user configuration containers, input forms, and dynamic data modules by exactly 8% to 10% using layout CSS variables. This ensures optimal readability and enforces a high-end luxury minimalist workspace reminiscent of modern macOS interface design on responsive displays.

Must implement this configuration framework as a strictly unified, neutral interface layout. Instead of building split, fragmented dashboards for buyers and sellers, this unified management system handles both user types flawlessly inside a singular layout file. The backend systems engineer must treat phone numbers and legal names as critical variables, locking active purchasing functions, track delivery chains, and A&R review submissions until form fields pass validation parameters.

Strict Mandatory Linking Directive: Every single phrase or word styled in **bold** within the text below represents a high-priority keyword anchor. You are strictly required to wrap every bold text block in an active, fully functional anchor link (e.g., `<a href="/marketplace"><strong>Keyword</strong></a>`). These links must load instantly, render smoothly with zero lag, and route the user to their designated internal platform hub. No long dashes, double dashes, or baseline underscores are permitted anywhere across the template system files.

SECTION 1: UNIFIED ACCOUNT PORTAL INTERACTION MAP

- └─▶ 3D Glassmorphic Card 2: Cryptographic Authentication Engine
- └─▶ 3D Glassmorphic Card 3: Commercial B2B Corporate Registry Grid
- └─▶ 3D Glassmorphic Card 4: Global Streaming Network Sync Arrays
- └─▶ 3D Glassmorphic Card 5: Professional Creator Bio Text Block
- └─▶ 3D Glassmorphic Card 6: Interactive Avatar Asset Processing Node

SECTION 2: THE UNIFIED CONFIGURATION COMPONENT ARCHITECTURE

Must hardcode these explicit input modules directly into the centralized account template code files to secure top rankings on Google for high-intent professional queries.

◀ PROFILE WORKSPACE: UNIFIED USER CONFIGURATION PANEL

This secure interface manages your global core variables, communication arrays, and platform metadata. Fill out all required fields to activate track submission privileges and clear secure checkout channels.

1. Core Identity Verification Gateway

This section collects the essential data vectors required to execute legally binding copyright agreements for both creators and purchasers:

- **First Name (Mandatory Field Trigger):** Input your official first legal name. (System Selector Class: `input-first-name` , Data Constraint: Alpha String Only).
- **Last Name (Mandatory Field Trigger):** Input your official last legal name or family name. (System Selector Class: `input-last-name` , Data Constraint: Alpha String Only).
- **Contact Number* (Mandatory * Field Trigger):** Enter your active phone number including global country code variables. This variable functions as a critical anti-fraud identity checkpoint and is strictly required to execute a secure

ghostproduction rights transfer or complete a marketplace purchase. (System Selector Class: `input-phone-number` , Data Constraint: Numeric/Telephone Formatting Only).

- **Username (System Locked Unique String):** Your permanent unique platform identification handle. This value is assigned during signup and forms your immutable system routing link.
- **Display Name (Public Facing Identity Node):** Choose your public profile name. This specific string defines how your identity is displayed across the active account section, public designer grids, and verified transaction reviews.
- **Email Address (Primary Verification Channel):** Input your active communication address. This parameter routes high-priority alerts regarding new audio tracks, approved catalog items, and financial payment status updates.

2. Cryptographic Authentication Engine

Provides a secure system container allowing users to change security keys seamlessly without leaving the unified configuration dashboard:

- **Current Password Field:** Input your existing account access passphrase string. Leave this input block blank if you want to keep your current security key unchanged.
- **New Password Field:** Input your desired fresh security passphrase key. Leave blank to preserve existing credentials.
- **Confirm New Password Field:** Re-enter the fresh security key parameter to cross-check string parameters and verify structural input accuracy perfectly.

3. Commercial B2B Corporate Registry Grid

Optional professional invoicing fields engineered for global record labels, entertainment companies, and music production networks:

- **Company Name:** Enter your officially registered corporate business title. This label prints directly onto system checkout invoices and legal asset bills.
- **Tax Number / VAT ID:** Input your international corporate tax or business registration number to automate tax exemption variables across localized checkout loops.

4. Global Streaming Network Sync Arrays

Integrates external music portals directly into your platform identity file to verify industry credibility and maximize search visibility:

- **Facebook Link Array:** Input your official social page path string. (Pre-formatted input domain context: `[facebook.com/]` `(https://facebook.com/)`).
- **Instagram Link Array:** Connect your visual social profile. (Pre-formatted input domain context: `[instagram.com/]` `(https://instagram.com/)`).
- **SoundCloud Link Array:** Sync your external streaming preview catalog. This lets buyers trace your technical authority in electronic music. (Pre-formatted input domain context: `[soundcloud.com/]` `(https://soundcloud.com/)`).
- **Spotify Artist Link Array:** Connect your official verified artist platform profile to showcase your streaming metrics and historical chart presence directly. (Pre-formatted input domain context: `[spotify.com/]` `(https://spotify.com/)`).

5. Professional Creator Bio Text Block

- **About Me Descriptor Field:** Write a detailed, comprehensive description summarizing your professional career, audio engineering experience, software expertise, and genre specializations (e.g., Tech House, Afro House, Bigroom Techno, or UK Garage). Use keyword-focused terminology here to ensure search engine spiders index your profile page at the absolute top of organic results.

6. Interactive Avatar Asset Processing Node

- **Profile Picture Drop Zone:** Drag and drop your high-resolution profile picture file directly into this automated interface container, or click the link to browse local system storage. The system accepts JPG, JPEG, or PNG image configurations up to a maximum file size limit of exactly 5 megabytes.
- **Progress Tracking Bar:** A premium real-time visual progress counter displaying upload acceleration from 0 percent up to absolute asset processing completion. Displays a clean, clear message stating No file chosen until an asset interacts with the drop target container.

7. Terminal Interaction Node

- **Save Changes Command Button:** Trigger an asynchronous AJAX database update routine when clicked. This instantly verifies all fields, locks updated telephone strings, refreshes cache values, and displays a success notification panel on the user interface.

MENU SERVICES: VOCAL ENGINE & AUTOMATED COPYRIGHT ASSIGNMENT ENGINE

System Layout and Font Modification Mandate: The global user interface font configuration files must be expanded across all portal layouts, search grids, multi-step forms, and system-generated PDF layout screens by exactly 8 to 10 percent using clean, fluid layout CSS variables. This technical step ensures that technical audio attributes, descriptive topline search data, and highly granular legal text strings maintain an elite, high-end luxury minimalist look reminiscent of macOS user interface design across high-resolution screen formats.

Instruction for Interactive UX Sound Integration: Do not construct a silent browsing environment. Taking inspiration from advanced motion-driven visual layout systems, the interface must feature soft, high-fidelity sound effect triggers. Instantiation rules dictate that hovering over any product grid block, interactive card, or 3D glassmorphic option must execute a micro-sound pulse (low-amplitude audio blip). Clicking any expand trigger, left arrow element, or payment terminal button must trigger a crisp click interface sound asset. Provide an interface toggle switch inside the user navigation bar allowing immediate globally mapped muting of all sound effects at any time.

Strict Mandatory Linking Directive: Every single phrase or word styled in **bold** within the text below represents a anchor. You are strictly required to wrap every bold text block in an active, fully functional anchor link pointing directly to its corresponding GHOSTBUS internal page node (e.g., `<a href="/vocal-marketplace"><strong>Keyword</strong></a>`). These links must render smoothly, load with zero system lag, and dynamically route the user to their designated internal platform hub. No long horizontal dashes or line underscores are permitted anywhere across the template system.

Reference look - <https://vocalfy.com/>

SECTION 1: MASTER PLATFORM INFRASTRUCTURE INTERACTION MAP

[GHOSTBUS Vocal Hub Navigation Node]

SECTION 2: INTEGRATION FOR THE VOCAL MARKETPLACE

Hardcode these explicit database attributes, copywriting components, and backend verification gates directly into the platform core framework to secure absolute organic authority on search engine results pages.

◀ 1. THE VOCAL MENU SERVICE INTERFACE AND CATALOG INFRASTRUCTURE

The frontend layout engine must render the vocal catalog view page as a carbon copy of the premium electronic music production dashboard. To ensure advanced indexing and rank at the first position of search engine results, every unique vocal asset entry list row must be linked to a schema table showing the following metadata sorting parameters:

- **Vocal Gender Sorting Parameter:** Clear binary and non-binary categorization strings (Male, Female, Other).
- **Tempo Tracking Variable:** Explicit Beats Per Minute integer metric values (e.g., 126 BPM, 140 BPM).
- **Root Scale Structural Key:** Explicit musical root key notation attributes (e.g., A Minor, F Sharp Major).
- **Electronic Music Sub-Genre Filter:** Grouped by strict club sub-categories including Tech House, Afro House, Bigroom Techno, UK Garage, and Progressive House.
- **Licensing Framework Type Flag:** Categorized cleanly as either 100 percent exclusive buyout assets or premium royalty-free packages.

The Buyer Intake Banner Component Copy

When a commercial user interacts with the navigation bar and selects the dedicated vocal marketplace service page, the header region must render this semantic copywriting block verbatim using bold typography rules:

Get premium royalty-free vocals, browse professional ready-made vocals & hire world-class professional vocalists for your commercial music releases.

The Unified Floor-Ready Deliverables Checklist Module

Directly below the streaming audio waveform canvas inside each vocal asset overview details page, render a 3D glassmorphic information card detailing the exact structural components packed into the delivery stream. The visual grid must detail:

- **DRY VOCALS:** Raw, uncompressed recording stems printed without time-domain or spatial mixing effects, preserving initial tracking dynamics.
- **WET VOCALS:** Meticulously processed acapellas featuring high-end spatial delays, customized reverbs, vocal tuning, and professional equalization chains.
- **MIDI FILES:** Comprehensive melodic MIDI data blocks replicating the precise phrasing, scale variations, and tracking melodies of the recorded vocals.
- **LYRICS PDF:** A clean documentation archive containing the written song structure, textual lyrics, and arrangement markers.
- **EXCLUSIVE RIGHTS LICENSE:** A digital copyright assignment certificate validating full master exploitation and distribution rights clearance.

◀ 2. DUAL-CREATOR INTAKE ARCHITECTURE: THE VOCALIST ONBOARDING ROUTE

To streamline our marketplace talent pipeline, the backend authorization engineer must integrate an alternative onboarding choice directly inside the baseline **Start Selling** landing page.

System Architecture Rules for Dashboard Mirroring

When a user selects the alternative option labeled **Apply as a Vocalist**, the platform system must instantiate a mirrored profile registration state. The developer must reuse the exact high-end user interface structure, navigation nodes, 3D glassmorphic account widgets, and asset tables built for the standard track seller panel.

The configuration differences operate entirely inside the form ingestion components, which are optimized specifically for checking and mapping voice traits, studio equipment parameters, and vocal licensing types. This architecture keeps data paths clean while providing vocalists with a familiar, top-tier workspace.

◀ 3. THE PROFESSIONAL DYNAMIC VOCALIST ASSET UPLOAD WIZARD

When an onboarded, verified vocalist interacts with the creator dashboard to list a new piece of work, the multi-step asset upload matrix must enforce the following three sequential collection stages:

Step 1: Textual Metadata Ingest and Search Tags Config

The submission form fields must ingest these technical strings to feed the front-end vocal search grids:

- **Asset Performance Name:** Title case song-style title configuration strings.
- **Primary Recording Language:** Target language specification value (e.g., English, Spanish).
- **Target Sub-Genres:** Selection boxes allowing up to 5 distinct club categories to let buyers filter files effortlessly.
- **Root Scale Key & Scale Profile:** Input selectors defining the musical scale structure.
- **Vocal Gender Parameter:** Core physical scale property strings (Male, Female, Other).
- **Studio Tracking Hardware Parameters:** Dynamic text boxes requiring the explicit model specifications of the recording microphone (e.g., Neumann U87) and matching studio microphone pre-amplifier used during the session.

- **Comprehensive Descriptive Attributes:** Compelling descriptions combined with searchable mood terms, artist styling tags, and targeted electronic record label style matching matrices (allowing up to 5 distinct reference markers).

Step 2: High-Fidelity Audio Influx Files

- **The MP3 Listening Preview Node:** Ingest an audio preview file containing the vocals mixed down alongside a basic MIDI melodic instrumental background track. Capped tightly at a maximum asset file storage metric of 20 megabytes, formatted cleanly as a 320 kbps MP3 stream.
- **The Master Audio ZIP Archive Node:** Ingest one consolidated, highly organized master ZIP package containing all high-resolution deliverables. The system folder architecture must parse and verify that the file tree includes separate directories containing clean **DRY VOCALS**, fully mixed **WET VOCALS**, melodic vocal **MIDI FILES**, and the written **LYRICS PDF** before activating the next step.

Step 3: Visual Interface Ingestion (Cover Artwork)

- **Visual Graphic Node:** Drag & drop your cover artwork image or click to browse local files. Minimum required resolution is exactly 500x500 pixels, capped at a maximum storage weight of 10 megabytes. Supported file formats: PNG, JPG, JPEG only.

Financial Pricing Parameters and Milestone Commission Scaling

The baseline marketplace pricing rules scale predictably using the exact hardcoded €50 increments matching the standard track portal framework. The automated calculator component must read the creator's lifetime transaction milestone data from the database session and downscale the platform commission fee fraction instantly as their volume shifts across ranks:

- **New Seller Rank Status:** Standard entry level positioning block. Applies a 28% platform commission fee deduction, leaving a clean 72% profit fraction directly inside the creator's profile balance.
- **Rising Seller Rank Status:** Triggered automatically at €5,000 in lifetime marketplace total sales value. The system drops the platform fee configuration token down to 25%, granting a permanent 75% payout split.
- **Pro Seller Rank Status:** Triggered instantly at the €10,000 lifetime sales milestone. The platform fee matrix decreases to 22%, expanding the individual seller yield split to 78% on every transaction.
- **Elite Seller Rank Status:** Triggered immediately upon crossing €30,000 in total store volume. The system commission downscales to an 18% fee slice, routing an 82% net layout back into the wallet.
- **Legend Seller Rank Status:** The ultimate platform achievement tier, unlocked permanently at €50,000 in transaction checkouts. The system fee drops to our lowest possible level of 15%, delivering a massive 85% maximum buyout fraction straight to the vocalist.

INDIVIDUAL VOCAL PRODUCT VIEW PAGE (BUYER VIEW ARCHITECTURE)

WAVEFORM DISPLAY AND MEDIA LAYOUT HIERARCHY

Directly beneath the primary audio preview player canvas on the vocal overview subpage, the frontend engineer must instantiate a floating block grid. This section outlines exactly what assets are transferred to the buyer upon checking out.

[Main Waveform Preview Audio Player Canvas]

[Floating Info Cards: "What Is Included In Your Purchase Package"]

└─► **DRY VOCALS** (Raw Studio Audio Stems, No Effects)

- └─► **WET VOCALS** (Fully Mixed Acapellas, Custom **EQ** & Reverb Spatial Layers)
- └─► **MIDI FILES** (Melodic Capture **of** the Performance Phrases)
- └─► **LYRICS PDF** (Clean Text Document **for** Lyrics Arrangement Tracking)
- └─► **EXCLUSIVE RIGHTS LICENSE** (Complete Certified Copyright Assignment Document)

SECTION 3: AUTOMATED REAL-TIME CONTRACT GENERATION & SIGNING

LOGIC

Core Systems Engineering Protocol: Do not deploy the following legal agreement text block as static, immutable code templates. The backend systems engineer must integrate an automated database parsing hook that operates the exact millisecond a creator initializes the final step of the upload pipeline.

When the user enters their signature parameters and clicks the authorization box, the compiler script must instantly clone the master legal text, query the active database state, and dynamically swap out the string variables. The system must current automatatically inject the exact **Song Title**, the creator's **Legal Full Name**, their **Artist Alias**, and the current automated **Server Clock Timestamp** directly into the document content.

The engine must then instantly export this complete legal payload as a permanent, read-only PDF document locked securely inside the **Admin Panel Layout**. Administrative managers must be provided with an explicit, one-click download action link right next to every seller profile line and track queue entry, ensuring airtight legal protection before approving the music for public sale.

[User Form Interface Action Signature Input]

[Backend Script Injects Current Server Variables]

(Dynamic Track Title, Legal Name, Timestamp, IP)

|

[Headless PDF Compiler Exports Read-Only Binary File]

|

[Document Permanently Locked to Admin Panel Row Entry]

SYSTEM DATA ASSIGNMENT MATCH ID: [UNIQUE_DOCUMENT_GENERATION_ID]

GHOSTBUS MASTER COMPLIANCE STANDARD TO PUT IN THE BOX

In the box example -

The screenshot shows a dark-themed web form titled "ASSIGNMENT OF RIGHTS" and "AGREEMENT WITH EDM GHOST PRODUCTION". It contains a list of terms and conditions, a checkbox for "I accept the Terms & Conditions" (which is circled in red), a signature field with a placeholder box and a small "x" icon, and a blue "Submit track" button at the bottom. A red checkmark is visible to the left of the signature field. The form is set against a dark background with a subtle grid pattern.

IN THE BOX : current automatically fit in - current seller details , current submitting song name , timestamp & unique id

VOCALIST & VOCAL COPYRIGHT TRANSFER AGREEMENT

This Vocalist & Vocal Copyright Transfer Agreement (“Agreement”) is a legally binding contract between GHOSTBUS (“Company”) and the Vocalist, Singer, Songwriter, Performer, Session Artist, Topliner, or Contributor (“Vocalist”), verified under system user account tracking code: **[SELLER_ACCOUNT_UUID]**.

By submitting, recording, uploading, delivering, licensing, or participating in any vocal, topline, lyrical, spoken-word, chant, adlib, hook, phrase, melody, performance, or audio contribution through the GHOSTBUS platform or related projects, the Vocalist fully agrees to all terms below.

1. PURPOSE OF THIS AGREEMENT

GHOSTBUS operates as a premium EDM ghost production marketplace facilitating the anonymous transfer of exclusive music productions, vocals, toplines, and related intellectual property rights to Buyers worldwide. The Vocalist acknowledges and agrees that:

- All vocals delivered for GHOSTBUS are created strictly under a Ghost Production framework.
- The Buyer purchasing the final Work shall possess full commercial exploitation rights.
- The Vocalist permanently waives any future public claim, ownership claim, artist claim, royalty claim, or public association with the Work unless explicitly agreed in writing by GHOSTBUS.
- Confidentiality, exclusivity, and anonymity are essential elements of this Agreement.

2. DEFINITIONS

The specific asset cataloged under file tracking name **[TRACK_ASSET_NAME]** includes but is not limited to: lead vocals, background vocals, spoken phrases, vocal chops, adlibs, hooks, lyrics, melodies, harmonies, vocal recordings, toplines, demo vocals, AI-assisted vocal performances, vocal stems, acapellas, MIDI vocal melody recreations, and any derivative vocal content engineered by the creator.

3. FULL COPYRIGHT ASSIGNMENT

3.1 Irrevocable Rights Transfer

The Vocalist irrevocably transfers to GHOSTBUS 100% worldwide copyright ownership, all neighboring rights, all performer rights, all exploitation rights, commercial rights, publishing rights, mechanical rights, synchronization rights, distribution rights, adaptation rights, derivative rights, and monetization rights. This transfer is exclusive, perpetual, irrevocable, worldwide, royalty-free, unlimited, transferable, and sub-licensable.

3.2 Buyer Ownership Rights

The Vocalist acknowledges that GHOSTBUS may transfer or sublicense the Work to Buyers, labels, artists, DJs, record companies, publishers, streaming platforms, brands, media companies, advertisers, gaming companies, film studios, or third parties globally. The Buyer may release the Work under any artist name, register copyrights, monetize the Work, modify the vocals, edit the lyrics, replace parts of the performance, use AI processing, use the vocals commercially, register the Work with labels or distributors, and claim performer identity for branding purposes without requiring any further approval from the Vocalist.

4. STRICT CONFIDENTIALITY & ANONYMITY

4.1 Permanent Confidentiality

The Vocalist agrees to permanent confidentiality regarding the existence of the transaction, Buyer identity, artist identity, label identity, project details, audio files, lyrics, payment information, production details, and communication history.

4.2 Non-Disclosure Restrictions

The Vocalist shall NEVER publicly claim authorship, reveal involvement, upload demos online, share stems, leak previews, post screenshots, share conversations, mention collaboration publicly, register claims through copyright systems, or upload files to Spotify, SoundCloud, YouTube, TikTok, Instagram, Discord, Reddit, or any platform unless explicit written authorization is provided by GHOSTBUS.

4.3 Penalty for Breach

The Vocalist acknowledges that anonymity and exclusivity are fundamental commercial requirements of Ghost Production. Any breach of confidentiality, ownership interference, public disclosure, copyright dispute, false claim, takedown attempt, or reputational damage shall result in immediate legal enforcement, permanent removal from GHOSTBUS, financial liability, a minimum contractual penalty of €100,000 EUR, and additional damages, losses, legal fees, lost revenue, brand damage, label losses, and third-party claims. GHOSTBUS reserves the unrestricted right to pursue civil, commercial, and international legal action.

5. ORIGINALITY WARRANTY

The Vocalist guarantees that all vocals are fully original, no unauthorized samples are used, no copyrighted melodies are copied, no third-party acapellas are included, no AI-generated content violates third-party rights, no hidden collaborations exist, no publishing conflicts exist, no prior agreements restrict the Work, the Work has not been sold elsewhere, and the Work is free from infringement claims.

6. EXCLUSIVITY

6.1 Exclusive Ownership

All delivered vocals become the exclusive property of GHOSTBUS immediately upon payment or submission approval. The Vocalist may not reuse melodies, resell lyrics, re-record identical vocals, duplicate hooks, republish vocal patterns, or license similar performances elsewhere.

6.2 Platform Exclusivity

The Vocalist agrees that any vocals submitted to GHOSTBUS cannot be uploaded elsewhere, cannot be listed on competing marketplaces, cannot be licensed privately, and cannot be distributed independently while active on the platform or attached to pending transactions.

7. NO ROYALTIES OR FUTURE CLAIMS

The Vocalist fully understands and agrees that no future royalties are owed, no streaming royalties are owed, no publishing percentages are owed, no performance royalties are owed, no neighboring rights are owed, and no backend compensation is owed unless separately agreed in writing by GHOSTBUS. The Vocalist permanently waives any future financial participation claims connected to the Work.

8. DELIVERY REQUIREMENTS

The Vocalist must provide professionally recorded materials including dry vocal stems, wet vocal stems, harmonies, adlibs, doubles, acapellas, lyrics sheet, BPM and key information, and session files if requested. All files must be cleanly labeled, professionally exported, free from clipping or distortion, studio quality, and commercial release ready.

9. AI VOCALS & SYNTHETIC PROCESSING

The Vocalist acknowledges that GHOSTBUS and Buyers may process vocals using AI, modify vocal identity, generate synthetic layers, change gender, tone, or formants, create vocal chops, create derivative vocal textures, and use machine-learning processing tools without restriction or additional approval.

10. NO CREDIT OBLIGATION

Neither GHOSTBUS nor the Buyer is obligated to credit the Vocalist, mention the Vocalist publicly, identify the Vocalist anywhere, or register the Vocalist publicly. The Vocalist explicitly waives all public attribution expectations.

11. LEGAL ENFORCEMENT

The Vocalist agrees that GHOSTBUS retains complete enforcement authority, GHOSTBUS may disclose Vocalist identity in legal disputes, GHOSTBUS may cooperate with labels, distributors, courts, publishers, and anti-fraud investigations, and GHOSTBUS may permanently ban violating users.

12. LIABILITY & INDEMNIFICATION

The Vocalist agrees to fully indemnify and hold harmless GHOSTBUS, Buyers, labels, distributors, and affiliated partners against copyright disputes, fraudulent claims, takedowns, monetization disputes, publishing conflicts, third-party lawsuits, DMCA claims, and performance-right claims, including all legal costs and attorney fees.

13. GOVERNING LAW

This Agreement shall be governed exclusively under the jurisdiction selected by GHOSTBUS operational legal structure and international intellectual property law. Any dispute shall be resolved exclusively through courts designated by GHOSTBUS.

14. ACCEPTANCE & RECOGNITION DEPLOYMENT

By checking the system confirmation box and clicking the validation interface button, the tracking database records the digital signature of the Vocalist, permanently stamping their legal attributes into this micro-formatted compliance file.

- **Vocalist Legal Full Name:** [SELLER_LEGAL_NAME]
- **Vocalist Professional Artist name Tag:** [SELLER_ARTIST_ALIAS]
- **SONG TITLE ASSIGNED:** [TRACK_ASSET_NAME]
- **TIMESTAMP DIGITAL SIGNATURE SECURE VALUE:** [CURRENT_SERVER_TIMESTAMP_ISO]

- **SYSTEM REGISTRATION ORIGIN IP ADDRESS:** [SELLER_IP_ADDRESS_HASHED]

INTERACTIVE DESIGN ARCHITECTURE & DATA COLLECTION FUNNELS

System Layout and Font Modification Mandate: The global user interface font configuration files must be expanded across all portal layouts, authorization screens, registration grids, and payment gateways by exactly 8% to 10% using clean, fluid layout CSS variables. This technical step ensures that metadata parameters, input field hints, and user configuration toggles maintain an elite, high-end luxury minimalist look reminiscent of macOS user interface design across high-resolution screen formats.

Instruction for Fluid Fluid-Motion UI (Haptic Motion Engine): Do not render a static or rigid web interface. The frontend engineer must implement an advanced, elite motion design language across the entire platform. Every icon, button, input field, menu grid cell, and navigation item must utilize responsive spring-physics animations built natively via hardware-accelerated CSS transformations or modern web animation libraries. If a user touches, hovers over, or interacts with any visual element, it must respond with a smooth, fluid floating weight translation (e.g., an organic vertical micro-float or an elastic scale bubble expansion) that feels deeply satisfying, intuitive, and fun to navigate.

Strict Mandatory Linking Directive: Every single phrase or word styled in **bold** within the text below represents a high-priority semantic SEO keyword anchor. You are strictly required to wrap every bold text block in an active, fully functional anchor link pointing directly to its corresponding GHOSTBUS internal page node (e.g., `<a href="/authentication"><strong>Keyword</strong></a>`). These links must render smoothly, load with zero system lag, and dynamically route the user to their designated internal platform hub. No long horizontal dashes or line underscores are permitted anywhere across the template system.

SECTION 2: PLATFORM CONFIGURATION AND COMPONENT SPECIFICATIONS

Must hardcode these explicit database protocols, single-click social sign-in frameworks, and checkout field restrictions directly into the template files to secure absolute organic authority and lock down the first ranking position on Google.

◀ 1. STREAMLINED OAUTH 2.0 ENGINE: SINGLE-CLICK GOOGLE SIGN-IN/UP ONLY

To eliminate conversion friction, bypass obsolete manual credential input layouts completely. Must structure the user sign-up and log-in views using a unified single-button authentication interface.

- **OAuth Single-Click Integration:** Implement an optimized Google OAuth 2.0 protocol as the absolute entry method for both buyers and creators to sign up or log in.

- **Database Influx Logic:** The microservice must instantly fetch the user's verified name strings, email strings, and secure profile image URLs directly from the Google API payload to map them to the corresponding **GHOSTBUS** user profile account rows.
- **Motion Interface Feedback:** The Google button node must sit inside a premium 3D glassmorphic card container. When a cursor hovers over or a finger touches the component, it must respond with a magnetic tracking float effect, shifting slightly toward the interaction source.

◀ 2. HIGH-INTENT TRANSACTION GATE: MANDATORY CHECKOUT COMMUNICATION DATA

To protect payment processing safety, prevent chargeback vectors, and maintain direct carrier communication loops for high-value transactions across our **edm ghostproduction marketplace**, the payment workflow page must inject a critical validation field before allowing a user to process a transaction.

- **Mandatory Communication Ingestion Field:** The backend system totals form must force the buyer to supply their verified personal contact mobile phone digits before activating the primary purchase execution button.
- **Integrated International Code Selector:** The interface must render a searchable, automated country code dropdown module (e.g., +1 for United States, +44 for United Kingdom, +91 for India) featuring localized visual flag icons.
- **Strict Character Validation Logic:** The code structure must sanitize input strings, allowing only numeric characters to pass. If the sequence layout fails validation length algorithms matching the selected country standard, block checkout routing loops and flash an animated floating micro-error window prompting the user to repair their contact information.

SECTION 3: SYSTEM RECOVERY FIELD NODE UPDATE

- **Platform Security Fallback Copy:** **Forgot your access credentials? Click here to instantly reset your password via a verification code sent directly to your registered Gmail address.**

: SYSTEM ENGINEER VERIFICATION ROUTING PROTOCOL

The systems infrastructure engineer must wire the backend routing loop to execute with zero latency:

[Click Reset Link Trigger] —▶ [Query OAuth Gmail Variable] —▶ [Fire Instant SMTP Code Payload]

INTERACTIVE MULTI-VERSION AUDIO PREVIEW LAYER

Instruction for UI, UX, and Audio Engineering Integration:

Do not deploy a flat, single-stream audio playback asset..Build a modular, high-end 3D glassmorphic player card layout for every single track listing showcased on the homepage and catalog search pages.

The player must feature a primary audio waveform container displaying the main Extended Mastered mix. Directly beneath this main wave visualization canvas, the interface must render a horizontal selector array featuring dedicated sub-playback buttons for three separate alternative versions: **Radio Mix**, **Instrumental Mix**, and **Radio Instrumental Mix**.

The backend audio processing team must build an automated, server-side watermarking engine. The moment a track is uploaded, the script must overlay a custom GHOSTBUS high-fidelity vocal or acoustic protection watermark across every single preview file at non-predictable internal intervals.

The global user interface font files must be expanded across this entire module by exactly 8 to 10 percent using fluid CSS layout adjustments. Every core search term marked in **bold** must be wrapped in an active, fully functional anchor link pointing directly to its corresponding target directory on the site.

SECTION 1: SYSTEM INTERACTION ARCHITECTURE MAP

SECTION 2: AUDIO INTERFACE FRONTEND & BACKEND SPECIFICATIONS

The developer must hardcode these structural layout protocols, audio handling mechanics, and copywriting arrays directly into the primary application files.

◀ 1. MULTI-STREAM WAVEFORM SYNCING AND CORE PLAYER INTERFACE

The player component must support high-fidelity multi-stream switching without breaking the visual interface flow of the marketplace page.

- **Continuous Single-Instance Playback:** If a user triggers a alternative version preview (such as the Instrumental Mix), the player canvas must immediately switch its source stream to that specific asset file without lagging or duplicating active audio instances.

- **Visual Active State Toggles:** When an alternative stream is engaged, the corresponding option bar must illuminate with a soft, glow styling indicator matching our luxury minimalist design system.
- **Global Volumetric Watermarking:** The system must stream low-bitrate versions of the preview assets combined with the protective sound tag. The full-quality, uncompressed master WAV files remain safely encrypted within our distribution storage layers, completely inaccessible via browser inspection windows.

◀ 2. STRUCTURAL CONTENT LAYOUT FOR ALTERNATIVE PREVIEWS

Directly within the product listing interface card, use this precise text structure to guide the user through the listening experience:

ASSET PREVIEW SELECTION INTERFACE MATRIX

The database audio rendering components must map to the layout blocks illustrated below:

Active Preview Stream Node	Underlying File Source Vector	Protected Streaming File Delivery Rule
MAIN Extended Master Mix	Mastered Extended WAV Influx	Audio stream contains periodic platform protective watermark
Radio Mix Option	Mastered Radio Mix WAV Influx	Audio stream contains periodic platform protective watermark

Instrumental Mix Option	Mastered Extended Instrumental WAV	Audio stream contains periodic platform protective watermark
Radio Instrumental Option	Mastered Radio Instrumental WAV	Audio stream contains periodic platform protective watermark

Seller Wizard note:

To optimize your track visibility , uploaded master ZIP archive must contain clean separate files for your Extended Master, Radio Edit, Extended Instrumental, and Radio Instrumental mixes so that buyers can preview all available alternative versions directly from the homepage.
